Pecafil® Weather Protection Screen

Prevents bad weather conditions from affecting
your work schedule in winter!

Application

Especially during the winter months work schedules on construction sites are often affected by harsh weather and low temperatures.

Pecafil® weather protection screen, comparable to a light admitting temporary seal of buildings and structural elements, is the ideal solution to this problem.

Pecafil® allows for easy enclosing of openings of any size, from large openings of unfinished buildings to simple, semi-transparent partitions.

Benefits

- Protects against wind, snow and dust
- Admits light
- Easy to handle
- Short fixing time
- Elements can be fitted and bent manually on-site

Simple on-site fitting!

The material

Pecafil® weather protection screens consist of a galvanised wire mesh coated with a transparent and UV-stabilised PE film.

The UV stabilised film is guaranteed for 2 years.

As a standard, Pecafil® is available in sheet widths from 140 to 420 cm and in lengths of 240 cm.

Pecafil® weather protection screens are also available with an additional coating of a special heat shrunk bubble wrap that provides heat insulation values comparable to those of normal glass.
